Cellpose: a generalist algorithm for cellular segmentation

In the format provided by the
authors and unedited

	256 pix	512 pix	1024 pix
DNN (1net, GPU)	0.054 s	0.12 s	0.31 s
DNN (1net, CPU)	0.30 s	0.65 s	2.4 s
DNN (4net, GPU)	0.23 s	0.41 s	1.3 s
DNN (4net, CPU)	1.3 s	2.5 s	9.1 s
Postprocessing (CPU)	0.32 s	1.2 s	6.1 s

Table S1: Cellpose run times divided into the time it takes to run the deep neural network (DNN) and the time for postprocessing (gradient tracking, segmentation, quality control etc.). The DNN runtime is shown using either a GPU (Nvidia GTX 1080Ti) or a CPU (Intel 10-core 7900X), with or without network ensembling (4net vs 1net). The postprocessing runtime is similar regardless of ensembling or CPU/GPU version. Runtime is shown for different image sizes, all with a cell diameter of 30 pixels (the average from our training set).
